MEMORANDUM FOR ARL Technical Library - APG, ATTN: Ms. P. Pepin

SUBJECT: Distribution Statement for BRL Report No. 47

- 1. Reference: BRL Report No. 47, "Velocity Uniformity and Piezo-Electric Gauge Records of Various Types of Charge for the 10" Gun", by R. H. Kent, April 1936.
- 2. We have determined that BRL Report No. 47 does not contain any sensitive information. Request that you mark your copy of the report with the following distribution statement:

APPROVED FOR PUBLIC RELEASE; DISTRIBUTION IS UNLIMITED.

3. We have sent a copy of BRL Report No. 47 to LB&B Inc. As requested, we have asked that LB&B deposit the report in the Defense Technical Information Center and forward a copy to Lawarence Livermore National Laboratory.

4. Our action officer is Douglas Kingsley, X6960.

## VELOCITY UNIFORMITY AND PIEZO-ELECTRIC GAUGE RECORDS OF VARIOUS TYPES OF CHARGE FOR THE 10" GUN

In Connection with Project KW 250 - Study of the Factors Involved in the Design of Propelling Charges.

#### Abstract

Piezo-electric gauge records were taken of the pressure of single section and two section unstacked charges and also of four section stacked charges. It was found that the four section stacked charge was the only type that gave smooth pressure-time curves. The velocity dispersion for this type of charge was much smaller than for the other ones.

#### Introduction

A number of charges of different types were fired in January and February 1936, in the 10" gun in connection with 0.P. 's 5240 and 5310. Piezo-electric gauge records of some of these rounds were obtained. The object of this report is to discuss the velocity uniformity results obtained in the light of the character of the piezo-electric gauge records.

### Piezo-electric gauge apparatus

Piezo-electric gauge records were taken for each type of round. These were the first records in which the cathode ray oscillograph was used to record the pressures of guns more

remote from the Instrument Building than the Main Front. Dr. Hodge built an amplifier which was placed near the gun. The output was taken directly to the cathode ray oscillograph for the firings on January 17.

It was found that there was a considerable distortion of the calibration records made on this date. This lead to a study of the theory of the propagation of waves along wires, a theory which was developed many years ago by Heaviside, Poincare' and others. In the light of this theory it was found that the waves are reflected at the practically open end of the circuit at the plates of the oscillograph. It was seen that to prevent the reflection of these waves, it was necessary to have the end of the line shunted by a resistance which is approximately equal to the impedance of the line per cm., about 300 ohms. This made it necessary to introduce a second amplifier near the oscillograph, the output of which was impressed on the plates of the cathode ray oscillograph.

The system seems to have a tendency to oscillate which is probably the cause of the broadening of the lines as shown in some of the records obtained in the firings of February 19.

Although the records obtained on the whole are considered rather promising some more development will have to be made before they can be depended upon for quantitative purposes.

#### Results

The velocity results obtained with these charges and other details are given in the attached firing records Nos. 8794 and 8833. From the firing records, it may be seen that the mean deviations in velocity for the three types of charge are as given in the table below:

Type of Charge	No. of Rds.	Mean Deviation in Velocity *f/s
Single section unstacked	$\mathcal{V}_{+}$	18.5
Two section unstacked	5	9.4
Four section stacked	$l_{\downarrow}$	3.3

<sup>\*</sup> Solenoid velocities only considered.

Diagrams of the types of charge are shown in fig. 1.

#### Type of Charge

The diameter of the chamber is 11.8 inches.

Fig. 1. Copies of the piezo-electric gauge records are attached.

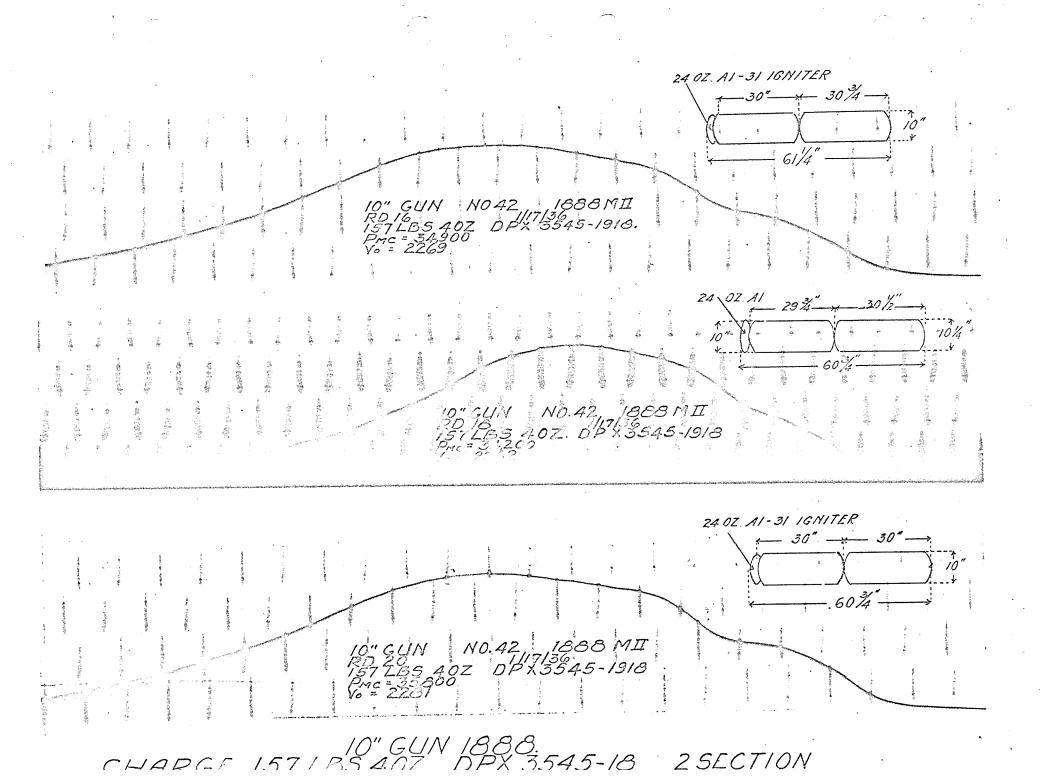

#### Discussion

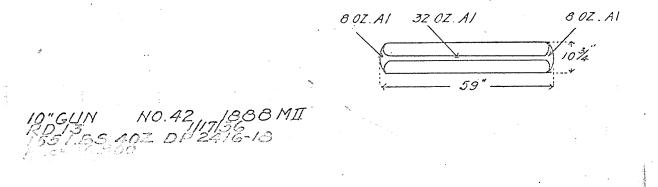

It may be seen that with the unstacked charges, pressure waves of appreciable amplitude occurred and there does not seem to be much difference between the amplitude of the waves produced by the two types of charge. On the other hand the oscillations of the pressure-time curves obtained with the stacked 4-section charge are much smaller than those obtained with the other types of charge. As has been stated the mean deviation obtained with the stacked charges was much less than the mean deviation for either type of unstacked charge. This result confirms the results obtained in the 155 mm Gun G.P.F. (See Report No. 45) and also the results obtained in the 75mm Gun 1897 and the 3" Gun

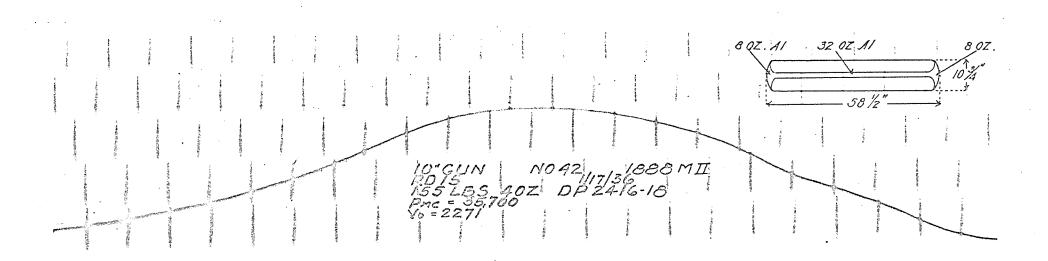

Model 1917, namely, that if a type of charge has a large dispersion in velocity and also appreciable pressure waves, a change in the method of ignition or arrangement of the charge which reduces the amplitude of the pressure waves, will also reduce the dispersion in velocity.

This lot of powder originally tested on July 13, 1931 in 10" Gun, Model 1888, No. 21 (53 rounds previously fired) using the single section bag with a core igniter of 48 ozs. (8-32-8). The mean M.V. (Boulenge) of five uniformity rounds with a charge of 158 los. was 2258 f.s., Max. Var. of 30 f.s. or 1.33%, M.D. of 13.0 f.s. The Mean Pressure was 36,187 lbs., Max. Var. of 1700 lbs. or 4.70%. These results are not corrected for erosion. Firings made with 617 lb. C.I.T.P. Shell, Mod. 1911.

There were no hangfires, flarebacks, misfires or evidence of unconsumed powder on any round, except as noted.

Round 14. - Misfire. Waited fifteen minutes, replaced primer. Second primer misfired. Third primer functioned satisfactorily. Failure of primers due to bad wiring connection on firing look. Primers removed had not been fired.

It is noted that went hole in obturator spindle is not straight. It bows up about 1/16" maximum.

Piszo-electric pressures taken on all rounds by Dr. Hodge, Mr. Peck and Mr. Durham from Instrument Section.

T. K. VINCENT, Capt.,Ord.Dept., Proof Officer.

APPROVED:

C. M. WESSON, Col.,Ord.Dept., Commanding. K. F. ADAMSON, Lt.Col.,Ord,Dept., Chief Proof Officer, Our Testing Division.

No change in gun or carriage since last firing.

There were no hanglines, misfires, flarebacks or evidence of unconsumed powder on any round.

Gun and carriage functioned satisfactorily on all rounds.

T3 Electric Primers, P.A. Tost Lots E-5670-65 4 -66 were tested in conjunction with this firing. (For reports on firing, see F.R. Nos. 8834 & 8835).

The charge recommended to give a service muzzle velocity of 2250 fees is 163 lbs. 4 ozs. with a corresponding pressure of 31600 lbs. per sq.in.

Charge velocity - chargo pressure curve attached horeto.

T. K. VERCERT, Capte Ordebooks,
